Stress level measurement test for human bodies by drinking TC WATER WHITE-ARADIN \pm GLASS water

Measurement sample

TC WATER WHITE-ARADIN + GLASS water

Measurement condition

1) Measurement date April 7, 2010

Measurement environment Room temperature 20°C Humidity 43%
 Measurement equipment Stress level measurement instrument

Measurement method

Following measurements were performed for two test subjects (a 41 years old female, a 54 years old male).

- 1) Stress level of body before drinking was measured.
- 2) Subjects drank about each 150cc of TC WATER WHITE-ARADIN + GLASS water and the stress level after 30 minutes was measured.
- 3) Same test was performed 2 times respectively. The interval between tests was 2 hours.

Measurement result

Results by drinking TC WATER WHITE-ARADIN + GLASS water

Stress level improvement (Unit: KIU/L)

	1 st time		2 nd time	
	41 yrs old female	54 yrs old male	41 yrs old female	54 yrs old male
Before drinking	63	59	48	53
30 min. after drinking	45	52	40	49
Improvement rate	39%	12%	17%	8%

For KIU, K = Kg, I = International unit, <math>U = Unit

Conclusion

According to the result of stress level measurement, the reduction of stress level was apparently observed 30 minutes later after drinking TC WATER WHITE-ARADIN + GLASS water. We do not know what caused this effect, but it indicates that there is considerable degree of stress improvement effect by drinking TC WATER WHITE-ARADIN + GLASS water for a long-term.

For your information, the table shows the rough scale of stress level determined at the scientific conference.

0 to 30 KIU/L	No stress
31 to 45 KIU/L	Some stress
46 to 60 KIU/L	Yes
61 or more KIU/L	Great degree
